

CIVIC INNOVATION & INSTITUTIONAL GOVERNANCE

Turning Citizen Reports into Institutional Accountability

An open case-management platform for transparent public-service delivery: a case of waste management across Sub-Saharan Africa.

Verified Evidence

Tamper-proof photo & geotag intake

Enforceable Dispatch

Direct routing to licensed field operators

Closed-Loop Audit

Mandatory before & after proof of work

When a Citizen Reports a Problem, What Next?

Complaints without visible response: the accountability breakdown in municipal public delivery.

CITIZEN FRUSTRATION

The Reporting Black Hole

When public services fail, citizens vent on social media or make disconnected phone calls. Reports vanish into unmonitored silos with no reference IDs, no tracking status, and no assigned owner.

OPERATIONAL BLINDSPOT

The Field Verification Void

Agencies cannot independently verify whether field operators actually executed a task or simply reported it complete on paper. The absence of objective proof allows ghost cleanups to persist unchallenged.

SYSTEMIC CONSEQUENCE

The Erosion of Civic Trust

When citizens submit reports that disappear into silence, public engagement collapses. Communities stop reporting, illegal practices normalize, and municipal infrastructure deteriorates unchecked.

The core issue in public services is not a lack of citizen complaints—it is the absence of an enforceable, transparent workflow that converts complaints into verified institutional action.

Waste Management: Where Delivery Failure Is Most Dangerous

Across fast-growing Sub-Saharan megacities, waste breakdown threatens public health and causes urban flooding.

SCALE & VOLUME

13,000+ Tons Every 24 Hours

In cities like Lagos, municipal solid waste generation far outpaces static collection schedules. Without dynamic real-time reporting, waste overflows into informal open dumpsites daily.

INFRASTRUCTURE THREAT

Drainage Clogs & Flash Floods

Uncollected waste naturally migrates into secondary drainage canals and primary storm channels. A single unaddressed dumpsite during heavy rainfall triggers catastrophic community flooding.

COORDINATION DISCONNECT

Three Siloed Stakeholders

Over 20 million residents, hundreds of licensed private waste contractors (PSPs), and regulatory agencies (LAWMA) operate without a unified digital ledger to coordinate dispatch and verify service delivery.

Waste management is the ultimate stress test for public accountability: if an institution cannot verify whether a street corner was cleaned, it cannot deliver complex municipal services.

The Itesiwaju Platform

An open case-management platform connecting citizens, operators, and regulators into one closed loop.

PILLAR 1

Citizen Reporting

Frictionless incident intake via mobile app and chat channels. Citizens capture real-world photo evidence with automatic GPS location tagging.

PILLAR 2

Verified Triage

Reverse geocoding resolves the street and ward automatically. AI verification screens for valid waste, filters out spam, and tags urgency levels.

PILLAR 3

Operator Dispatch

Cases route directly to the designated private waste contractor (PSP) covering that ward, creating an accountable job card with strict SLA timers.

PILLAR 4

Proof-of-Work Audit

Field operators must submit timestamped before-and-after photos on site. Cases cannot close without objective proof of resolution.

THE CLOSED-LOOP LIFECYCLE

Report Logged → Evidence Verified → Operator Dispatched → Photo Proof Submitted → Case Closed

How It Works in Practice

Clear operational roles, immutable timestamps, and complete elimination of unverified claims.

STEP 1

Citizen Reports

Resident captures a photo of overflowing bins or an illegal dump. GPS coordinates and device timestamp are captured automatically.

STEP 2

Automated Triage

Geocoding resolves exact street, ward, and LGA. Computer vision screens for waste content and priority (e.g. drainage obstruction vs. residential overflow).

STEP 3

Operator Dispatch

The assigned PSP contractor receives the digital job card with precise coordinates. Response timers begin counting down against the SLA.

STEP 4

Verified Resolution

Field crew clears the site, captures mandatory on-site photo proof, and submits resolution. Regulators verify and the citizen is notified.

100%

Photo-Verified Resolutions

< 24h

High-Priority Target Response

Immutable

Event Trail for Every Report

Designed for Real Citizens Across All Demographics

Civic technology only works when it meets people where they are, on devices they already use.

Multi-Channel Ingestion

Over 90% of Nigerian smartphone owners use WhatsApp daily. We support zero-friction reporting through direct messaging and lightweight mobile apps, eliminating heavy downloads.

Indigenous Multilingual UI

Built natively for **English**, **Yorùbá**, and **Nigerian Pidgin**. Whether a tech-savvy youth or a market trader in Balogun, every citizen can interact in their comfortable tongue.

Anonymous & Safe Reporting

Flagging industrial polluters, cart pushers, or illegal neighborhood dumpers can carry social friction. Citizens can opt for anonymous reports while retaining full case tracking visibility.

Inclusive civic design removes friction. By supporting WhatsApp, local languages, and anonymous reporting, Itesiwaju ensures broad neighborhood adoption across all income levels.

Information You Can Trust

Every report starts with evidence: tamper-resistant proof, automated geocoding, and AI classification.

EVIDENCE FOUNDATION

Tamper-Resistant Proof

Every submission binds together photographic evidence with device timestamps and high-precision GPS coordinates. No subjective text-only complaints or untraceable claims.

AUTOMATED INTELLIGENCE

Automatic Geocoding

Citizens do not need to type confusing street names. Our reverse geocoding engine automatically resolves latitude and longitude into exact street names, wards, and Local Government Areas (LGAs).

QUALITY & ANTI-SPAM

AI-Assisted Classification

To protect operators from spam or fake submissions, integrated computer vision models (Roboflow) automatically inspect images to verify waste, classify material types, and flag priority hazards.

High-trust public governance requires high-trust data. By combining geotagged evidence, automated geocoding, and AI spam screening, Itesiwaju ensures public resources are only dispatched to genuine incidents.

How the Platform Sustains Itself

A practical public-private model designed to align incentives across the civic value chain.

GOVERNMENT REGULATORS

Agency Licensing (B2G)

Annual enterprise software subscription for municipal waste agencies and state environmental ministries for centralized SLA oversight, contractor auditing, and flood-prevention monitoring.

PRIVATE WASTE OPERATORS

Operator Subscriptions (B2B)

Operational dispatch software for licensed private PSP contractors to receive verified job cards, optimize collection routes, and protect contract billing with unchallengeable proof-of-work.

CIRCULARITY & INDUSTRY

Recycling Data Insights

Aggregated, anonymized material classification data licensed to recycling companies and FMCG packaging manufacturers to verify Extended Producer Responsibility (EPR) compliance.

Total Addressable Market: 25+ rapidly urbanizing African metropolitan areas facing identical waste accountability, flood prevention, and contractor coordination challenges.

What We Have Built & Validated

A functioning, tested operational foundation ready for live field trials.

OPERATIONAL BACKEND

Core Platform Architecture Active

- **Live Case Engine:** Case creation, assignment, and status transition APIs deployed.
- **Cloud Evidence Storage:** Direct Cloudinary image ingestion pipeline operational.
- **Automated Geocoding:** Reverse coordinates to street, ward, and LGA active.
- **Immutable Audit Trail:** Case event ledger records every action from report to closure.

MOBILE APPLICATION

Working Citizen Mobile Client

- **Live Camera & Upload:** Real-time photo capture and cloud storage integration.
- **High-Precision GPS:** Automatic coordinate acquisition with live accuracy indicator.
- **Multilingual Engine:** English, Yorùbá, and Nigerian Pidgin toggles on the fly.
- **Timeline & Tracking:** Residents view active status and verified resolution evidence.

PILOT DEMONSTRATION

A 90-Day Operational Pilot in Lagos

We are seeking pilot partnerships with municipal sanitation authorities and waste operator associations to deploy across 5 high-density wards in Lagos.

Target 1

5,000 Cases

Logged, triaged, and resolved with full before-and-after photographic evidence.

Target 2

50% Faster

Reduction in turnaround response time for high-severity drainage blockages.

Target 3

Zero Disputes

Eliminating unverified contractor claims through timestamped photo proof.

Thank you. We welcome your questions.
